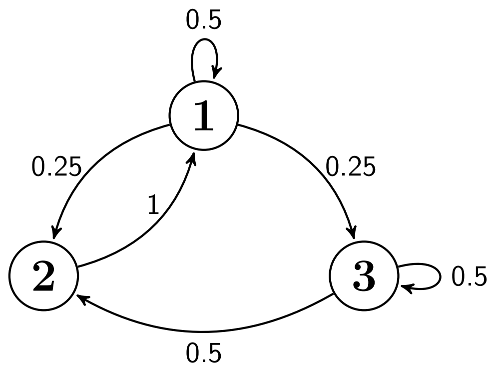
Total:	100	

Answer each question in the space provided. There are 7 questions for a total of 100 points.

Problem 1

(a) [2 points] Consider the following Markov chain:



Write the transition matrix P

(b) [3 points] Suppose you have the transition matrix $P = \begin{bmatrix} 0.75 & 0.25 \\ 0.75 & 0.25 \end{bmatrix}$. If the state probabilities at $k = 6$ are $\begin{bmatrix} 0 \\ 1 \end{bmatrix}$, find the state probabilities at $k = 7$.

(c) [3 points] For the transition matrix given in part (b), find the steady-state state probabilities, $\boldsymbol{s}^{\star}$.

(d) [1 point] For the transition matrix given in part (b), does this Markov chain have an absorbing state? (Yes/No)

(d) ____________

(e) [1 point] Is the solution you found in part (c) unique? In other words, is this the only valid steady-state distribution? (Yes/No)

(e) ____________

(f) [1 point] For the Markov chain in part (a), if $\mathbf{s}(10) = \mathbf{s}(11)$, can we say that the steady state distribution is $\mathbf{s}(11)$? (Yes/No)

(f) ____________

Problem 2 10 points

Let

$$A = \begin{bmatrix} 0 & 2 \\ 3 & 0 \end{bmatrix} \qquad B = \begin{bmatrix} -1 & 2 & 3 \\ 2 & -1 & 1 \end{bmatrix} \qquad C = \begin{bmatrix} -1 & 0 & 0 \\ 1 & -1 & 0 \end{bmatrix}$$

Find each of the following quantities or write "not defined" if the operation is not defined.

(a) A^2

(b) $(\frac{1}{\sqrt{6}}A)^{23}$

(c) $A(BC^T)$

(d) $(C(B^T A^T))^T$

(e) $(C^T C)B$

Problem 3

(a) Suppose T is a linear transformation from $\mathbb{R}^2$ to $\mathbb{R}^2$ that maps the vector $\mathbf{x} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$ to $T(\mathbf{x}) = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$ and the vector $\mathbf{y} = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$ to $T(\mathbf{y}) = \begin{bmatrix} 2 \\ 4 \end{bmatrix}$.

i. [1 point] Is the domain all of $\mathbb{R}^2$? (Yes/No)

i. __________

ii. [1 point] Is the codomain all of $\mathbb{R}^2$? (Yes/No)

ii. __________

iii. [1 point] Is the range all of $\mathbb{R}^2$? (Yes/No)

iii. __________

(b) [2 points] Suppose T is a linear transformation from $\mathbb{R}^3$ to $\mathbb{R}^2$ that maps the vector $\mathbf{x} = \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$ to $T(\mathbf{x}) = \begin{bmatrix} 1 \\ 3 \end{bmatrix}$ and the vector $\mathbf{y} = \begin{bmatrix} 1 \\ 1 \\ 2 \end{bmatrix}$ to $T(\mathbf{y}) = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$. If $\mathbf{z} = \begin{bmatrix} 4 \\ 2 \\ 5 \end{bmatrix}$, what is $T(\mathbf{z})$?

(c) Suppose T is a linear transformation from $\mathbb{R}^2$ to $\mathbb{R}^2$ such that $T(\mathbf{x}) = A\mathbf{x}$. Write the standard matrix A for each of the following transformations.

i. [3 points] T first reflects about the x_2 axis, then rotates 90 degrees counter-clockwise about the origin, and then projects onto the x_2 axis.

ii. [3 points] T rotates by 180 degrees clockwise about the origin, and then reflects about the x_1 axis.

(d) [2 points] Select all transformations from part (c) that are **onto**. Put a check mark ✓ in the box next to **EACH** correct answer.

☐ i. ☐ ii.

(e) [2 points] Select all transformations from part (c) that are **one-to-one**. Put a check mark ✓ in the box next to **EACH** correct answer.

☐ i. ☐ ii.

(f) Consider the linear transformation from $\mathbb{R}^2$ to $\mathbb{R}^3$ given by $T(\mathbf{x}) = \begin{bmatrix} x_1 - 2x_2 \\ 2x_1 - 4x_2 \\ ax_2 - x_1 \end{bmatrix}$ where a is a constant.

i. [2 points] Write the standard matrix A of this transformation.

ii. [2 points] For what values of a (if any) is T **one-to-one**?

ii. ____________

iii. [2 points] For what values of a (if any) is T **onto**?

iii. ____________

iv. [2 points] For what values of a (if any) is T **invertible**?

iv. ____________

Problem 4

(a) Consider the following matrix:

$$\begin{bmatrix} 1 & 0 & 2 & 0 \\ 0 & a & b & c \\ 0 & 0 & 0 & d \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Here a, b, c, and d represent constant parameters. If this matrix is in *reduced* row echelon form, and there are *three pivots*, then what must be the values of these four parameters? For each parameter, either write a specific number or write "any number" if the parameter can have any value.

i. [2 points] What must be the value of a?

i. ____________

ii. [2 points] What must be the value of b?

ii. ____________

iii. [2 points] What must be the value of c?

iii. ____________

iv. [2 points] What must be the value of d?

iv. ____________

(b) [2 points] What is the reduced row echelon form of the following matrix?

$$\begin{bmatrix} 2 & 1 & 0 & 4 & 5 & 6 \\ 0 & 7 & 0 & 9 & 8 & 7 \\ 0 & 0 & 0 & 5 & 4 & 3 \\ 0 & 0 & 0 & 0 & 7 & 1 \\ 0 & 0 & 0 & 0 & 0 & 4 \end{bmatrix}$$

(c) Consider a system of linear equations of the form $Ax = b$, where the matrix A is 3-by-5 and the column vector x consists of the five unknown variables $x_1, x_2, \ldots, x_5$. Suppose the reduced row echelon form of the augmented matrix is given by

$$\begin{bmatrix} A & b \end{bmatrix} \xrightarrow{\text{rref}} \begin{bmatrix} 0 & 1 & 2 & 0 & 3 & 5 \\ 0 & 0 & 0 & 1 & 4 & 6 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

i. [3 points] Which of the unknown variables are free?

ii. [2 points] Does the solution set pass through the origin in $\mathbb{R}^5$ (yes or no)?

ii. ____________

Problem 5 [12 points]

Answer each of the following three questions in the space provided.

(a) Consider matrices A and B below:

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} \qquad B = \begin{bmatrix} b_{11} & b_{12} & b_{13} \\ b_{21} & b_{22} & b_{23} \\ b_{31} & b_{32} & b_{33} \end{bmatrix}$$

If matrix A is singular and B is nonsingular, which of the following matrices *must* be singular? Put a check mark ✓ in the box next to **EACH** correct answer.

- ☐ $B^{-1} \cdot A$
- ☐ $A^2 \cdot B^T$
- ☐ $(A + B)B$
- ☐ $\begin{bmatrix} 1 & 1 & 1 \\ 2a_{21} & 2a_{22} & 2a_{23} \\ 2a_{31} & 2a_{32} & 2a_{33} \end{bmatrix}$

(b) Let $E = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$. Using B from part (a), what is the inverse of $B^{-1} \cdot (E^{-1})^T$?

(c) Let $C = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 2 & 4 \\ 0 & 0 & 2 \end{bmatrix}$. Is C^T invertible? If so, compute $(C^T)^{-1}$.

Problem 6 (18 points)

Answer TRUE or FALSE for each of the following statements. You do not have to explain your answer. (1.5 points each)

(a) If $\{\mathbf{x}, \mathbf{y}\}$ is a linearly independent set and $\mathbf{z}$ is **not** in Span$\{\mathbf{x}, \mathbf{y}\}$, then $\{\mathbf{x}, \mathbf{y}, \mathbf{z}\}$ is linearly independent.

(a) ____________

(b) If a matrix is in reduced row echelon form, then the entry in its upper left-hand corner must be 1.

(b) ____________

(c) The solution set for a system of linear equations of the form $A\mathbf{x} = \mathbf{b}$ can contain exactly three distinct vectors.

(c) ____________

(d) If a matrix A has a row of all zeros, then the system of linear equations $A\mathbf{x} = \mathbf{b}$ must be inconsistent.

(d) ____________

(e) If a vector $\mathbf{b}$ is in the span of the columns of matrix A, then $A\mathbf{x} = \mathbf{b}$ must be consistent.

(e) ____________

(f) If a linear transformation from $\mathbb{R}^5$ to $\mathbb{R}^5$ is onto, it must also be invertible.

(f) ____________

(g) If a linear transformation from $\mathbb{R}^5$ to $\mathbb{R}^5$ is one-to-one, then the the span of the columns of its standard matrix must be the same as its codomain.

(g) ____________

(h) If a matrix product AB exists and is invertible, then both A and B must be invertible with $(AB)^{-1} = B^{-1}A^{-1}$.

(h) ____________

(i) If a matrix product AB exists and has all zero entries, then either A or B (or both) must have all zero entries.

(i) ____________

(j) A linear transformation defined by a matrix with more columns than rows cannot be one-to-one.

(j) ____________

(k) If the set $\{\mathbf{a}_1, \mathbf{a}_2, \ldots, \mathbf{a}_n\}$ is linearly dependent, then the linear transformation defined by $A = [\mathbf{a}_1\ \mathbf{a}_2 \cdots \mathbf{a}_n]$ is one-to-one.

(k) ______________

(l) If A and B can both be row reduced to the identity matrix, then $A = B$.

(l) ______________

Problem 7 (11 points)

Write a function called `is_invertible` that checks if the linear transformation $T(x) = Ax$ is invertible. The function has one input, the standard matrix `A`, and one output, a logical scalar `inv`. The matrix `A` can have arbitrary size. If the transformation is invertible, `inv` should be `true`. Otherwise, it should be `false`. *For this problem, you may use any built-in MATLAB function, but you* **must** *use the output(s) of* `rref` *(or equivalently,* `reduce` *from Homework 5) to decide whether* `inv` *is true or false. Do not use loops.* No error checking, help lines, or comments are necessary. Assume the input `A` is not empty.
